Onboarding Checklist

1. You will have received an email titled "Set up your ML4AI Lab account" with a secure link. Click it and set a password and/or passkey. (It arrives alongside a general welcome email — the setup link is in the separate one.)
2. Log into the wiki by clicking "Log in" at the top right of this page. This will create an account on the wiki that is automatically linked to your lab account.
3. Log into the lab's Zulip chat at https://zulip.lab.pyarelal.xyz using the lab single sign-on — this is where day-to-day lab communication happens.
4. Log into the lab's project management platform by going to https://vikunja.lab.pyarelal.xyz. This will create an account for you on the project management platform that is automatically linked to your lab account. Once you have done this, please email Adarsh at adarsh@arizona.edu so that he can add you to the relevant projects.
5. Visit the lab dashboard at https://lab.pyarelal.xyz and sign in — you'll find lab service status there, and more over time.
6. If you've been granted LLM API access, generate your personal API key at https://lab.pyarelal.xyz/llm-key (see LiteLLM for usage).
7. To get SSH access to orca, follow the steps in Managing SSH keys with Kanidm. Note that host access also requires an admin to add you to the host's login group — ask if you haven't been.
